Tracy Aviary – Plant Intern

An opportunity at Tracy Aviary has arisen for a student looking to further their knowledge of plant identification and scientific data surveying. Tracy Aviary is working to update the plant records database by identifying and documenting existing plants in the aviary’s diverse established gardens and avian exhibits. Through this opportunity, the selected candidate will become fluent identifying ornamental, indoor tropical and native plants of Utah, including trees by using dichotomous keys along with other available resources. Once identified, this information will be scientifically recorded and transferred into the Tracy Aviary plant database following an outlined procedure. The intern will also participate in the identification and labeling of botanically significant or interesting plants throughout the aviary for public education. This internship provides invaluable experience in a unique field setting for students to practice data collection and plant identification and also learn about plant and bird relations along with conservation.

Please send your resume and a brief cover letter to jessicab@tracyaviary.org
